

Algorithm

↳ Sequence of finite steps to perform some specific task.

Example → a, b

Multiplication of two number

- 1. Take two number → a & b .
- 2. Take $C = a * b$.
- 3. Return C .

Properties of an Algorithm

- 1) Terminate after finite amount of time
- 2) Produce atleast One Outcome.
- 3) Independent of any programming language
- 4) Unambiguous / Deterministic
 - ↳ Independent of time

Example → `while(True):`

`print("hi there!")` → not an Algorithm

Steps to construct an Algorithm

- 1) Problem Definition
- 2) Design algorithm →
 - Divide & Conquer
 - Greedy Algo
 - Dynamic Programming
 - & Many More
- 3) Draw Flow Chart
- 4) Testing
- 5) Implementation

6) Analysis

Asymptotic Notation

↳ Big O → Worst Case scenario

↳ Omega → Best Case scenario

↳ Theta → Average Case scenario

A priori Analysis → Order of Magnitude of statement

Example 1) $x = y + z \rightarrow \text{Constant } c$
↳ $O(1)$ (No Loop)

Example 2) $x = y + z \rightarrow 1 \text{ time}$
 $\text{for}(\text{int } i = 0; i < n; i++) \{ \rightarrow O(n) \text{ time}$
 $\quad x = y + z;$
 $\quad \}$
 $(n+1) \text{ times} \Rightarrow O(n)$

Example - 3) $x = y + z \rightarrow 1 \text{ times}$
 $\text{for}(i \rightarrow 0 \text{ to } n-1) \{$
 $\quad x = y + z; \rightarrow n \text{ times}$
 $\}$

```

for (i → 0 to n-1) {
    for (i → 0 to n-1) {
        x = y + z; → n² time
    }
}

```

Example - 4) $n = 5;$
 $i = n;$
 while ($i > 1$) { → (n-1) time ⇒ $O(n)$
 $i = i - 1;$
 } cout << "Hi There!"

Example 5) $i = n$
 while ($i > 1$) { → $\frac{n}{3}$ times ⇒ $O(n)$
 $i = i - 3;$
 } cout << "Hi There!";

Example 6) $i = 1;$
 while ($i < n$) {
 $i = 2 * i$ ↔ $i = 3 * i$ → $O(\log_3 n)$
 cout << i;
 }
 $O(\log_2 n)$ ← $O(\log n)$

Example 7) $i = n$

while ($i > 2$) {

$i = i^{1/2} \rightarrow [n^{1/2^k} = 2]$ stopping
criteria

taking log both side

$$\log n^{1/2^k} = \log 2$$

$$\frac{1}{2^k} \log n = 1 \Rightarrow \log n = 2^k \text{ (taking log)}$$

$$\Rightarrow \log_2(\log_2 n) = 1$$

$$\Rightarrow [k = \log_2(\log_2 n)]$$

1) $i = n$

while ($i > 2$) { $\rightarrow n^{1/25^k} = 2$

$$\left. \begin{array}{l} i = i^{1/25} \\ \} \end{array} \right\} \Rightarrow \log_2 n^{1/25^k} = \log_2 2 \Rightarrow \frac{1}{25^k} \log_2 n = 1$$

$$\Rightarrow \log_2 n = 25^k \Rightarrow \log_{25} \log_2 n = 1$$

$$\Rightarrow k = \log_{25} \log_2 n$$

2) $i = 29$

step by step Analysis

while $i < n$:

$$i = 29 \rightarrow 29^{23} \rightarrow 29^{23^2} \rightarrow 29^{23^3} \dots 29^{23^k}$$

$$i = i^{23}$$

$$\hookrightarrow \text{hence } [29^{23^k} = n]$$

$$\rightarrow \log_{29} 29^{23^k} = \log_{29} n \Rightarrow 23^k = \log_{29} n$$

$$\rightarrow \log_{23} 23^k = \log_{23} \log_{29} n \Rightarrow k = \log_{23} \log_{29} n \underline{\underline{\text{Ans}}}$$

$$\rightarrow O(\log \log n)$$

$$3) i = 1$$

while $i < n$:

$$i = 2 * i \rightarrow i = 6 * i \rightarrow 6^k = n$$

$$i = 3 * i$$

$$\Rightarrow [k = \log_6 n] \rightarrow O(\log n) \underline{\underline{\text{Ans}}}$$

Complexity classes:

1) Constant - $O(1)$

2) Logarithm - $O(\log n)$

3) Linear $\rightarrow O(n)$

4) Quadratic $\rightarrow O(n^2)$

5) Cubic $\rightarrow O(n^3)$

6) Polynomial $\rightarrow O(n^c)$

7) Exponential $\rightarrow O(c^n) -$
 $O(2^n)$

$$8) n! < n^n$$

$$2^n < n^n$$

$$n! > 2^n$$

$$2^n < n! < n^n$$

$$9) \log n < n$$

$$(\log n)^2 < n$$

$$(\log n)^3 < n$$

$$(\log n)^{1000} < n$$

$$(\log n)^{\log n} > n$$

→ True

$$10) 2^n < 3^n$$

$$2^n < (2 \times 1.5)^n$$

$$11) \log_2 n > \log_3 n$$

Recurrence Relation

- Substitution
- Recursive
- Master Theory

Substitution Method

$$1) T(n) = \begin{cases} 1 & , n = 1 \\ T(n-1) + n & , n > 1 \end{cases}$$

↳ A function calling itself

$$\Rightarrow T(n) = \underbrace{T(n-1)}_{\text{substitute}} + n \quad \text{--- 1st time}$$

$$T(n-1) = T(n-1-1) + n-1$$

$$T(n-1) = T(n-2) + n-1$$

$$T(n) = T(n-2) + n-1 + n \rightarrow 2^{\text{nd}} \text{ time}$$

$$T(n-1)$$

$$T(n) = T(n-3) + n-2 + n-1 + n \rightarrow 3^{\text{rd}} \text{ time}$$

$$T(n-2)$$

k times

$$T(n) = T(n-k) + n-k-1 + n-k-2 + \dots + n-1 + n$$

so for stopping criteria $[n-k=1]$ base case
hence $n-1=k$ replacing.

$$T(n) = T(n-(n-1)) + n-(n-1)+1 + n-(n-1)+2 + \dots + n-1 + n$$

$$\Rightarrow T(1) + 2 + 3 + \dots + n-1 + n$$

$$\Rightarrow 1 + 2 + 3 + \dots + (n-1) + n$$

$\hookrightarrow$ Sum of n natural numbers

$$\Rightarrow \frac{n(n+1)}{2} = \frac{n^2 + n}{2} = O(n^2) \underline{\underline{Ans}}$$

$$\text{Example - 2)} \quad T(n) = \begin{cases} 1 & , n=1 \\ T(n-1) + \frac{1}{n} & n > 1 \end{cases}$$

$$T(n) = T(n-1) + \frac{1}{n} \rightarrow 1^{\text{st}} \text{ time}$$

$$T(n) = T(n-2) + \frac{1}{n-1} + \frac{1}{n} \rightarrow 2^{\text{nd}} \text{ time}$$

$$T(n) = T(n-3) + \frac{1}{n-2} + \frac{1}{n-1} + \frac{1}{n} \rightarrow 3^{\text{rd}} \text{ time}$$

↓ k times

$$T(n) = T(n-k) + \frac{1}{n-k+1} + \frac{1}{n-k+2} + \dots + \frac{1}{n-1} + \frac{1}{n}$$

$$n-k=1 \Rightarrow \boxed{n-1=k}$$

$$\boxed{T(n) = T(1) + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \frac{1}{5} + \dots + \frac{1}{n-1} + \frac{1}{n}}$$

$$= 1 + \frac{1}{2} + \frac{1}{3} + \dots + \frac{1}{n-1} + \frac{1}{n}$$

$$= O(\log(n))$$

Example - 3) $T(n) = \begin{cases} 1 & n=1 \\ n * T(n-1) & , n > 1 \end{cases}$

↳ fibo recurrence relation

$$T(n) = T(n-1) * n$$

$$T(n) = T(n-2) * n-1 * n$$

$$T(n) = T(n-3) * n-2 * n-1 * n$$

↓
K times

$$n-k=1 \Rightarrow k=n-1$$

$$T(n) = T(n-k) * n-k+1 * n-k+2 * \dots * n-1 * n$$

$$= T(n-(n-1)) * n-(n-1)+1 * n-(n-1)+2 * \dots * n-1 * n$$

$$= T(1) * 2 * 3 * \dots * n-1 * n$$

$$\Rightarrow 1 * 2 * 3 * \dots * n-1 * n$$

$$\Rightarrow O(n!) \Rightarrow O(n^n)$$

Recursive Tree Approach

↳ More than one recursive term in the recursive relation.

Example $T(n) = \begin{cases} 1 \\ T(n/2) + T(n/2) + n \end{cases}$

$$\underline{T(n)} = T(n/2) + T(n/2) + \underline{n}$$

Left side

$$\frac{n}{2^K} = 1$$

$$\Rightarrow n = 2^K$$

Right side

$$\frac{n}{2^K} = 1$$

$$n = 2^K$$

$$\Rightarrow \log_2 n = \log_{\cancel{2}^k} 2^k$$

$$\Rightarrow \log_2 n = \log_{\cancel{2}^k} 2^k$$

$$\text{Ans} \rightarrow O(n * k) \Rightarrow O(n \log_2 n) \underline{A}$$

Example - 2)

$$T(n) = \begin{cases} 1 & , n=1 \\ T(n/5) + T\left(\frac{4n}{5}\right) + \underline{n} & , n>1 \end{cases}$$

Left Side

$$\frac{n}{5^{K_L}} = 1$$

$$\Rightarrow n = 5^{K_L}$$

$$\Rightarrow \log_5 n = K_L$$

Right Side

$$\frac{n}{\left(\frac{5}{4}\right)^{K_R}} = 1$$

$$K = \log_{5/4} n \rightarrow \text{greater}$$

$$\text{Time complexity} \rightarrow O(n * K_R)$$

$$\Rightarrow O(n \log_{5/4} n) \underline{A}$$

Basic Properties of Logarithm

$$1) a^x = n \Rightarrow \log_a a^x = \log_a n$$

$$x = \log_a n$$

$$2) \log_b 1 = 0$$

$$3) \log_a a = 1$$

$$4) \log_a (b/q) = \log_a b - \log_a q$$

$$5) \log_a bq = \log_a b + \log_a q$$

$$6) \log_a b^n = n \log_a b$$

$$7) a^{(\log_a b)} = b ; \Rightarrow b^{\log_a a} = b$$

$$8) \log_a n = \log_b n * \log_a b$$

$$9) \log_a b = \log_n b / \log_n a$$

10) Lower the base in logarithmic
→ higher the value

Master Theorem

$$T(n) = aT\left(\frac{n}{b}\right) + f(n)$$

$$f(n) = O(n^k \log^p n)$$

$$T(n) = 2T\left(\frac{n}{2}\right) + n^2$$

$$\begin{cases} a = 2 \\ b = 2 \\ k = 2 \\ p = 0 \end{cases}$$

case - 1) $\log_2 a > k$

Data Structure

collection of items in a contiguous manner

Base Address - 1000

85	75	70	65	98	99	50	33	47	77	42	71	69
0	1	2	3	4	5	6	7	8	9	10	11	12
$\downarrow$	1004	1008	-	-	-	-	-	-	-	-	-	-

Index

size(int) = 4 bytes

Address of 12th index = Base Address +

(i - lower bound) * size of each element

$$\Rightarrow 1000 + (9 - 0) * 4$$

$\Rightarrow 1036$ Ans

Searching

[20 45 27 47 55 67 75 88 90]

```
for (int i = 0; i < n; i++) {
```

```
    if (arr[i] == x) {
```

```
        return i
```

}

return -1

$$T(n) = O(n)$$

↳ worst case (Element present near to last Index)

Best case $\rightarrow O(1)$

↳ Element present near to the first Index

$$\text{Average case} \rightarrow \frac{1}{2} \cdot O(n) + \frac{1}{2} \cdot O(1) = O(n)$$

Binary Search

↳ Sorted Array
(Ascending or Descending)

[20, 30, 40, 50, 60, 70, 80, 90]

left = 0

target = 30

right = 7

```
BinarySearch( vector<int> &arr, left, right) {  
    while( left ≤ right ) {  
        int mid = left + (right - left) / 2;  
        if ( arr[mid] == target ) {  
            return mid;  
        }  
        else if ( arr[mid] < x ) {  
            left = mid + 1;  
        }  
        else {  
            right = mid - 1;  
        }  
    }  
    return -1;  
}
```

Recursion

↳ Calling the same function again inside the method definition

```
#include <iostream>
using namespace std;
```

```
int binarySearchRecursive(int arr[], int low, int high, int target) {
```

```
    if (low > high) {
```

```
        return -1;
    }
```

```
    int mid = low + (high - low) / 2;
```

```
    if (arr[mid] == target) {
```

```
        return mid;
```

```
    } else if (arr[mid] > target) {
```

```
        return binarySearchRecursive(arr, low, mid - 1, target);
```

```
    } else {
```

```
        return binarySearchRecursive(arr,
```
